

Horizontal Use of Miller MightyLite Self-Retracting Lifelines

Miller Fall Protection does not recommend the use of the Miller MightyLite self-retracting lifelines when the unit lays flat on the deck. In this situation, wearing of the entry guide nozzle will increase due to the angle and constant retraction of the lifeline. For applications where the Miller MightyLite self-retracting lifelines are used in a horizontal application Miller Fall Protection has designed the RoofStrider mounting bracket. The RoofStrider is a small tripod like bracket that attaches to the decking and holds the MightyLite in a horizontal position allowing it to rotate 360 degrees. This device keeps the retractable lifeline off the ground and decreases the amount of wear and tear that the unit would see during decking and horizontal use applications. By using the RoofStrider unit, the MightyLite will stay in an upright position and will allow the lifeline to retract and lay in the proper position inside of the unit.
